The FLStock class

An FLStock is mean to represent the perceived population dynamics of a given stock.

All quantities in a stock are stored in FLQuant objects. This allows for storage of by e.g. age or length, in years, units, seasons and areas.

- catch: Total catch (landings plus discards) in weight for all quants

The FLStock class

An FLStock is mean to represent the perceived population dynamics of a given stock.

All quantities in a stock are stored in FLQuant objects. This allows for storage of by e.g. age or length, in years, units, seasons and areas.

- catch: Total catch (landings plus discards) in weight for all quants
- catch.n: Catch in numbers by quant

The FLStock class

An FLStock is mean to represent the perceived population dynamics of a given stock.

All quantities in a stock are stored in FLQuant objects. This allows for storage of by e.g. age or length, in years, units, seasons and areas.

- catch: Total catch (landings plus discards) in weight for all quants
- catch.n: Catch in numbers by quant
- catch.wt: Weight at quant in the catch

The FLStock class

An FLStock is mean to represent the perceived population dynamics of a given stock.

All quantities in a stock are stored in FLQuant objects. This allows for storage of by e.g. age or length, in years, units, seasons and areas.

- catch: Total catch (landings plus discards) in weight for all quants
- catch.n: Catch in numbers by quant
- catch.wt: Weight at quant in the catch
- discards: Total discards in weight for all quants

The FLStock class

An FLStock is mean to represent the perceived population dynamics of a given stock.

All quantities in a stock are stored in FLQuant objects. This allows for storage of by e.g. age or length, in years, units, seasons and areas.

- catch: Total catch (landings plus discards) in weight for all quants
- catch.n: Catch in numbers by quant
- catch.wt: Weight at quant in the catch
- discards: Total discards in weight for all quants
- discards.n: Discards by quant in numbers

The FLStock class

An FLStock is mean to represent the perceived population dynamics of a given stock.

All quantities in a stock are stored in FLQuant objects. This allows for storage of by e.g. age or length, in years, units, seasons and areas.

- catch: Total catch (landings plus discards) in weight for all quants
- catch.n: Catch in numbers by quant
- catch.wt: Weight at quant in the catch
- discards: Total discards in weight for all quants
- discards.n: Discards by quant in numbers
- discards.wt: Weight at quant of the discards

The FLStock class

An FLStock is mean to represent the perceived population dynamics of a given stock.

All quantities in a stock are stored in FLQuant objects. This allows for storage of by e.g. age or length, in years, units, seasons and areas.

- catch: Total catch (landings plus discards) in weight for all quants
- catch.n: Catch in numbers by quant
- catch.wt: Weight at quant in the catch
- discards: Total discards in weight for all quants
- discards.n: Discards by quant in numbers
- discards.wt: Weight at quant of the discards
- landings: Total landings for all quants

The FLStock class

An FLStock is mean to represent the perceived population dynamics of a given stock.

All quantities in a stock are stored in FLQuant objects. This allows for storage of by e.g. age or length, in years, units, seasons and areas.

- catch: Total catch (landings plus discards) in weight for all quants
- catch.n: Catch in numbers by quant
- catch.wt: Weight at quant in the catch
- discards: Total discards in weight for all quants
- discards.n: Discards by quant in numbers
- discards.wt: Weight at quant of the discards
- landings: Total landings for all quants
- landings.n: Landings in numbers by quant

The FLStock class

An FLStock is mean to represent the perceived population dynamics of a given stock.

All quantities in a stock are stored in FLQuant objects. This allows for storage of by e.g. age or length, in years, units, seasons and areas.

- catch: Total catch (landings plus discards) in weight for all quants
- catch.n: Catch in numbers by quant
- catch.wt: Weight at quant in the catch
- discards: Total discards in weight for all quants
- discards.n: Discards by quant in numbers
- discards.wt: Weight at quant of the discards
- landings: Total landings for all quants
- landings.n: Landings in numbers by quant

The FLStock class

- stock: Stock weight for all quants. Usually obtained from an assessment method

The FLStock class

- stock: Stock weight for all quants. Usually obtained from an assessment method
- stock.n: Stock numbers by quant, output from a quant-structured assessment method

The FLStock class

- stock: Stock weight for all quants. Usually obtained from an assessment method
- stock.n: Stock numbers by quant, output from a quant-structured assessment method
- stock.wt: Weights at quant in the stock

Joint
Research
Centre

The FLStock class

- stock: Stock weight for all quants. Usually obtained from an assessment method
- stock.n: Stock numbers by quant, output from a quant-structured assessment method
- stock.wt: Weights at quant in the stock
- m: Natural mortality by quant

The FLStock class

- stock: Stock weight for all quants. Usually obtained from an assessment method
- stock.n: Stock numbers by quant, output from a quant-structured assessment method
- stock.wt: Weights at quant in the stock
- m: Natural mortality by quant
- mat: Maturity by quant, usually as a proportion

The FLStock class

- stock: Stock weight for all quants. Usually obtained from an assessment method
- stock.n: Stock numbers by quant, output from a quant-structured assessment method
- stock.wt: Weights at quant in the stock
- m: Natural mortality by quant
- mat: Maturity by quant, usually as a proportion
- harvest: Harvest mode rate by quant

The FLStock class

- stock: Stock weight for all quants. Usually obtained from an assessment method
- stock.n: Stock numbers by quant, output from a quant-structured assessment method
- stock.wt: Weights at quant in the stock
- m: Natural mortality by quant
- mat: Maturity by quant, usually as a proportion
- harvest: Harvest mode rate by quant
- harvest.spwn: Fraction of the harvest mode ocurring before spawning

The FLStock class

- stock: Stock weight for all quants. Usually obtained from an assessment method
- stock.n: Stock numbers by quant, output from a quant-structured assessment method
- stock.wt: Weights at quant in the stock
- m: Natural mortality by quant
- mat: Maturity by quant, usually as a proportion
- harvest: Harvest mode rate by quant
- harvest.spwn: Fraction of the harvest mode ocurring before spawning
- m.spwn: Fraction of the natural mortality ocurring before spawning
